This invention describes a novel protein MONP-2 (I) and its encoding gene monp-2 (II) with a cell proliferation promoting effect isolated from a human peripheral blood. The new protein (I) and gene are useful in studying the expression abnormality and dysfunction of (I) as well as maintenance of immune function and development of drugs for e.g. immune diseases and cancers. This sequence encodes the MONP-2 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                960 TGCATATGCTGGCTGGTTTTACCTCAACTTTGTTACTGAAGAAGTAGAAAACCCTGAAAA 1019

This invention describes a novel protein MONP-2 (I) and its encoding gene monp-2 (II) with a cell proliferation promoting effect isolated from a human peripheral blood. The new protein (I) and gene are useful in studying the expression abnormality and dysfunction of (I) as well as maintenance of immune function and development of drugs for e.g. immune diseases and cancers. This sequence encodes the MONP-2 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   960 TGCATATGCTGGCTGGTTTTACCTCAACTTTGTTACTGAAGAAGTAGAAAAAACCCTGAAAA 1019

The present invention describes a cell surface protein which is an L-type amino acid transporter-1 (LAT1), which mediates the transport of neutral amino acids, leucine, isoleucine, phenylalanine, methionine, tyrosine, tryptophan, value and histidine, into the cell independently of sodium ions. The LAT1 protein conjugates with the cell membrane surface molecule 4F2. Antisense DNA or RNA, antibodies, antibody fragments, and peptide and non-peptide antagonists to LAT1 are useful as anticancer agents. The present sequence encodes human LAT1, which is specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1046 CCATGGCCATTGTCACCATTGGCTATGTGCTGACAAATGTGGCCTACTTTACGACCATTA 1105

The present invention describes a library of human polynucleotides

C comprising the sequences given in AAZ12532 to AAZ1779. Also described is

C comperious state of a mammalian cell, comprising detecting at least one

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

cuspected of being cancerous, where the gene product is encoded by one

CC the 5148 polynucleotide sequences given in AAZ12532 to AAZ17779. The

cof the 5248 polynucleotide sequences given in AAZ12532 to AAZ17779. The

cof the 518 polynucleotide sequences of primers and probes, which can

compaping, tissue typing or profiling, forensics, genetic analysis and

detection of polymorphisms. Polypeptides encoded by the polynucleotides

cc antengentic purposes. The polynucleotides may also be used to construct

therapeutic purposes. The polynucleotides may also be used to construct

cc arrays for diagnostics (which may be used to determine function of an

encoded protein); and to detect differences in expression levels between

two cells (e.g. to identify abnormal or diseased tissue in a human, to

two cells (e.g. to identify abnormal or diseased tissue in a human, to

two cells, prognosis and management of colorectal cancer, breast cancer,

and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1105 AATGCTGAGGAGCTGCTGTTCAAATGCA-GTGGCAGTGACCTTTTCTGAGCGGCTACT 1163

The present invention describes a library of human polynucleotides

C comprising the sequences given in AA212532 to AA21779. Also described is comprising the sequences given in AA212532 to AA21779. Also described is a method of detecting all terantially expressed gene product in a test sample from a cell of differentially expressed gene product in a test sample from a cell of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA212532 to AA21779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between the construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between the construct and to detect differences in expression levels between the construct and the detect differences in expression levels between the construct and the detect of the construct and the constr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                two cells (e.g., to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics,

c giving an insight into their probable biological activities, and hence becential therapeutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell aematopolesis regulatory activity; tissue growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinelic activities; haemostatic, thrombotic or chemokinelic activities; haemostatic, thrombotic or proposed in oncogenesis, cancer cell proliferation or metastasis. thrombolytic activities; receptor or ligand activities; or may be pepending on their biological activities, polypeptides and nucleotides of conditions, e.g., by protein or preventing, treating or ameliorating medical cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal cy ascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound immunomodulatory activities may be used in the treatment of viral, conventides with arrowth fartor arrivity may be used in chart or mucle. Conventivity may be used in the properties of polyperides with marowth fartor arrivity may be used in the invention or includent to a promoter or material and fungal infections in addition to immune disorders. autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, screening techniques. The present sequence novel human polypeptide of the invention.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; cytokine; cell proliferation; cell differentiation; growth factor;

expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonocleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.

New human lung-specific polynucleotides and polypeptides for the diagnosis and treatment of disease e.g. lung cancer –

Claim 1; Page 332; 378pp; English

their corresponding cDNA molecules. Lung tunnour-specific proteins and their corresponding cDNA molecules. Lung tunnour specific proteins and their antiqen-presenting cells are useful for stimulating and/or expanding rells specific for a tunnour protein, and for inhibiting the development of cancer The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tunnour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence a cDNA encoding human lung tumour-specific protein.

Sequence 2239 BP; 619 A; 444 C; 493 G; 683 T; 0 other;

Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 32 Row: e Column: 19
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 9790234
This clone has the following problem: frame shifted.

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution:

                                                                                                                                                                                                                                                                                     Anote—Vector: pcDNA3; Site_1: BCORI; Site_2: BCORI; Human chole—Ibrary made from mRNA isolated from trabecular meshwork cells established fom eyes from 6 individuals, and seeks to 2 years. Cells were harvested at passages 3 through 6. Invitrogen made a unidirectional cDNA library from the mRNA from the frozen cells using a pcDNA3 vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2056 AGAACCTTCAAATTGAAGACTGAGATTTTTCTGTATATATGGGTTTTGTAAAGATGGTTT 2115

```

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the messenger RNAs that populate a genome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises conservation in the stanscribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a piological sample, in expression profiling studies, in qualitatively or consequences. The libraries are useful for detecting mRNAs from a piological sample, and splice variants of human or animal consequences. The libraries may also be used as specialised minicationary biological or pathological state, and so allowing the certifon of tissue- and pathological state, and so allowing the condition; to detect developmental specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA condition; to detect developmental specific genes; and to detect RNA condition; to detect developmental specific genes; and to detect RNA condition; to detect developmental specific genes; and to detect RNA condition; to detect developmental specific genes; and to detect RNA condition; but as sequences from rats, humans and mice, which are used in the sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cet fitpulpy. The sequences.

AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased that affect the activity of (I) by expressing inactive proteins or to cyplement the patients own production of (I). Additionally, (I) polyucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, cancers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK64950 and AAM82169
                                                                                                                                                                                                                    Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

                                                                                                                                                      09-AUG-2001
    ABL36412 to ABL38645 represent human colon tumour antigen cDNA clones (I) which were isolated from human colon tumour and colon metastatic tumour cDNA libraries. (I) have cytostatic activity and can be used in vaccine production. (I) can be used for stimulating and/or expanding T cells specific for a tumour protein on contact with the T cells. They are also useful for inhibiting the development of cancer in a patient. (I) can be used as probes or primers for nucleic acid hybridisation, for preparing mutant species primers, or primers for use in genetic constructions. (I) can be used in the diagnosis of a colon tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated colon tumor polynucleotide differentially expressed in colon tumor or colon metastatic tumor and polypeptides encoded by them, useful for inhibiting development of cancer in patient

The invention relates to an isolated polynuclectide (I) encoding a polypeptide (II) comprising at least a portion of a colon tumour the presence of a cancer in a patient. (I), (II) or antigen presenting cells expressing (I) is useful for stimulating and/or expanding T cells expressing (I) is useful for stimulating and/or expanding T cells presenting cells that express (I), under conditions and for a time sufficient to permit the stimulation and/or expansion of T cells.

CC (I), (II), or antigen presenting cells that express (II) are useful for treating colon cancer in a patient by incubating CD4+ and/or CD8+ T cells captaing colon cancer in a patient by incubating CD4+ and/or CD8+ T cells captain an effective amount of the proliferate of administering to the patient an effective amount of the proliferated T cells, thus inhibiting carcines and pharmaceutical compositions for prevention and treatment corrects. (I), (II) or (III) is useful for detection, diagnosis and/or cancers. (I), (II) or (III) is useful for detection, diagnosis and/or therapy of human colon cancer. (I) is useful as a probe or primer for concers. (I), (II) or inhibiting expression of (III) in tumour cells.

CC follon malignancies and for the diagnosis and monitoring of such therapy of human colon cancer. (I) is useful as a probe or primer for cancers. (I), (II) or III) is useful as a probe or primer for concers coding malignaries of the invantion of (III) in tumour cells.
                                                                                                                                                                                                                                                                                           Novel isolated polynucleotide encoding a polypeptide comprising a portion of colon tumour protein, useful for detection, diagnosis and therapy of human colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       334 GAGAAAGTGCAGCTGAAGAGGAAAGTCACTTTACTGAGGGGAGTCTCCATTATCATTGGC 393

Suspected of being cancerous, where product is anocaded by one of the 5248 polynucleotides can be used as a source of primers and probes, which can polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, detection of polymorphisms. Polypeptides encoded by the polynucleotides and can be used for raising antibodies for experimental, diagnostic and can be used for raising antibodies for experimental, diagnostic and arrays for diagnostics (which may be used to determine function of an two cells (e.g. to identify abnormal or diseased tissue in a human, to cancer). The polynucleotides in expression levels between diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for and lung cancer. The polynucleotides can also be used to screen for peptide analogues and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a library of human polynucleotides comprising the sequences given in AA112532 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            οy
                                                                                                                                                                genes correlated with a cancerous state of a mammalian cell, comprising genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test cancerous state of the differentially expressed gene product is correlated with a concerous state of the cell from which the test sample was derived. The polyuucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polyuucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and cerecting and mapping related genes. They can be used in diagnosis and corremensation on materatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, costrogen receptor-positive breast cancer, negative breast cancer, lung cancer, and colon cancer.
                                                                                                                                         libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; lung tumour protein; immunostimulant; cytostatic; gene therapy; antisense-therapy; vaccine; immune response; lung cancer; 20E10; ss.
                                             Polynucleotide library used to determine cancerous states of mammalian

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and expanding release useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune responses, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 CATAGAITITATCATATICIGGAITITITGGAITCITITGTITICICATCACTGGAITCA 180

```
The present invention describes a library of human polynucleotides comprising the sequences given in AA21253 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the dancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell of the 5248 polynucleotide sequences given in AA212532 to AA21779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and

ó
therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    I, Escobedo J, Innis MA, Garcia PD, Sudduth-Klinger J;

The present invention describes a library of human polynucleotides comprising the sequences given in AA212532 to AA21779 Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell cancerous, where the gene product is encoded by one consequence and product is encoded by one coll the 5248 polynucleotide sequences given in AA212532 to AA217799. The polynucleotides can be used as a source of primers and probes, which can be used for availety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polynucleotides encoded by the polynucleotides for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct therapeutic purposes. The polynucleotides may also be used to construct therapeutic purposes. The polynucleotides may also be used to construct carrays for diagnostics (which may be used to determine function of an enrays for identify abnormal or diseased tissue in a human, to two cells (e.g. to identify abnormal or diseased tissue in a human, to two cells (e.g. to identify abnormal or diseased tissue in a human, to dence or the polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, or and the detection as a polynucleotides can also be used to correct for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1187 CGATCTTTGTTGCCCTCTCCTGCTTTGGCTCCATGAACGGTGGTGTTTTGCTGTCTCCCA 1246

The present invention describes a library of human polynucleotides comprising the sequences given in AZ12532 to AZ1779. Also described is comprising the sequences given in AZ12532 to AZ1779. Also described is cancerous state of a mammalian cell, comprising detecting at least one differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell differentially expressed gene product in a test sample from a cell of suspected of being cancerous, where the gene product is encoded by one polynucleotides can be used as a source of primers and probes, which can be used for avariety of purpose, e.g. detection of expression levels, be used for a variety of purpose, e.g. detection of expression levels, detection of polynucleotides and detection of polynucleotides and detection of polynucleotides can be used to construct therapeutic purposes. The polynucleotides may also be used to construct therapeutic purposes. The polynucleotides may also be used to construct characterially and to detect differences in expression levels between a arrays for diagnostics (which may be used to determine function of an arrays for add to detect differences in a expression levels between the polynucleotides and determine function of an arrays for add to detect differences in a expression levels between the polynucleotides and an arrays for diagnostics (which may be used to determine function of an arrays for add to detect differences in a expression levels between the polynucleotides and an arrays for diagnostics which may be used to determine function of an arrays for add to detect differences in a expression levels between the polynucleotides and an arrays for diagnostic and an arrays of the polynucleotides and arrays for diagnostic and to detect differences in the expression levels between the polynucleotides and arrays for diagnostics (which may be used to determine the polynucleotides and arrays for diagnostics and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ12532 to AAZ1779. The

polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                        1099 ACCATTAATGCTGAGGAGCTGCTTTTCAAATGCAGTGGCAGTGACCTTTTCTGAGCG 1158

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forenaics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA

bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuropithelial cells autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                        ö

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of detecting the nucleotides of nucleotides of the invention. Although novel, many of the bind to polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence of potential therapeutic applications. The polypeptides of the invention may have various activities; is tem cell growth factor activity; have various activities; stem cell growth factor activities; haematopoisals regulatory activity; tissue growth activity; immunomodulatory activity; activin. or inhibin-related activities; chemotactic or chemokinetic activities; haemactatic, thromboth or may be conditions activities; activities; polypeptides and nucleotides of thrombolytic cativities; cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid call cancers, haematopoietic disorders (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., asthma or arthritis), arterial schaemia, bone disorders (e.g., sobperorsis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and vascular growth. Polypeptides involved with tissue regeneration and vascular growth. Polypeptides involved with tissue regeneration and bealing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral,
                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; growth factor; haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia;
                                                                                                                                                                                                                                                                                                     bone disorder; osteoporosis; vascular growth disorder;

their antigen-presenting cells are useful for stimulating and/or expanding I cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune responses, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.
New human lung-specific polynucleotides and polypeptides for the diagnosis and treatment of disease e.g. lung cancer ^{-}\,
